

How to Install TRU-Vu Panel-Mount Monitors

Once the monitor has been unpacked, lay it face down and unscrew the rear metal bracket by removing the silver M4 Phillips screws.

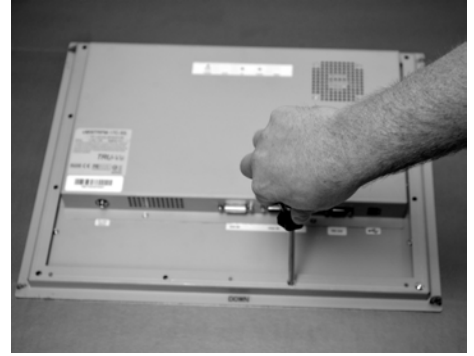

Remove all screws, then remove the rear metal bracket from the monitor.

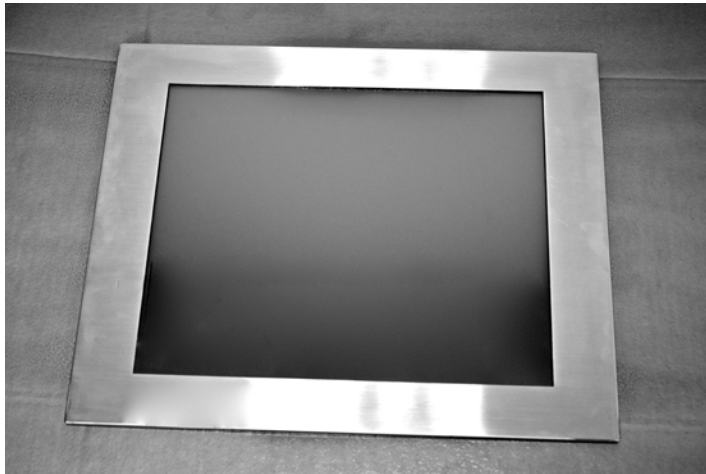

Now you should have the monitor, the rear metal bracket and the set of screws

Next, slide monitor into the opening from the front.
The back of the monitor will actually recess into the opening.

While holding the monitor in place, place the rear metal bracket in position and secure it with all screws. Ensure all screws are attached tightly.

Your panel-mount monitor is successfully installed.

IMPORTANT:

Due to irregularities/inconsistencies found on surfaces that the monitors will be mounted to, we **highly recommend** applying waterproof silicone around outer edge of the monitor's bezel for all waterproof panel-mount monitors. This will help ensure a watertight seal between the monitor and the surface to which it is mounted.
